

# Rapid Transition Sunglasses

## Fitting instructions

### “Glasses mode”

1. Prime each ear stem extension arm by pulling it towards the rear with one hand while holding the main frame with the other hand. You will need to do one arm at a time.
2. Compressive strength is incrementally increased by successive clicks, until the arms cannot be pulled any further.
3. Place the glasses over your head, and wear them as you would any other pair of glasses.
4. This position is “glasses mode”. The glasses fit loosely around your head, allowing air to flow on both sides of the lenses.

### “Goggles mode”

1. To rapidly transition to “goggles mode”, firmly seat the front frame and eye seals against the face and eye sockets. This is best done by grasping the left side of the frame around the lens with the left hand, and the right side of the frame around the lens with the right hand, and applying pressure towards your face and against your eye socket so as to achieve a sensation of suction.
2. You may need to experiment to achieve the appropriate balance between a comprehensive seal and a comfortable wear. This balance may be impacted by the context in which you are using the glasses and how effective a seal you want to achieve.
3. While holding the pressure on the face, use the index finger of each hand to feel for the trigger on each ear stem, and press the triggers. The ear stem extension arms will fully retract, thereby tightening the glasses around your head. You are now in “goggles mode”.
4. Each wearer’s face is unique and so each wearer may experience minor gaps at different parts of the seal, preventing a 100% seal. If this is a problem for you, here are some additional seating techniques to further improve the seal:
  - Pressing your palms into the bottom corner of the frames.
  - Firmly pressing across your nose bridge, attempting to seat the seal into the corner of your eye sockets.

### Return to “Glasses mode”

To return to “glasses mode” without removing the glasses from your head, you can simply grasp the frame around the lens using both hands, and pull the frame forward and away from your face, thereby priming the ear stem extension arms again (you will hear the familiar clicks as you do).
